

# Air Blocker for Clack 1" Control Valves

Clack Corporation has available its newest distributor family addition, the Air Blocker. The Air Blocker traps water in its chamber to block the head of air from re-entering the control valve body. This will help reduce the iron oxidation that occurs, in the control valve, on air over media systems. The Air Blocker will extend the valves' service life and cleaning intervals, over systems without an air blocker. It is designed with the twist-lock feature that has an o-ring seal and will only work on Clack 1" control valves with 1.050 riser pilot. Patent Pending.
